MEMORANDUM

OFFICE OF
PESTICIDES AND TOXIC SUBSTANCES

SUBJECT: PP#7G3525. Iprodione on Stored Corn Grain: TAS
Dietary Exposure Analysis.

FROM: Susan L. Stanton *Susan L. Stanton* 06/13/88
Tolerance Assessment Program
HED/RCB (TS-769C)

THRU: Karl Arne, Ph.D. *e tick for K.A.*
Branch Senior Scientist 06/14/88
HED/RCB (TS-769C)

TO: Lois Rossi/Mario Fiol, PM 21
Herbicide-Fungicide Branch
Registration Division (TS-767C)

Action Requested

Provide TAS estimates of dietary exposure to the fungicide iprodione from the proposed experimental use on stored field corn grain.

RCB has reviewed the petition and, TOX considerations permitting, recommends that the proposed tolerance of 20 ppm be established to cover residues which may occur as a result of the proposed experimental use (memo L. Propst to L. Rossi, 06/08/88).

Discussion

1. A routine chronic exposure analysis was conducted using a Reference Dose (ADI) of 0.04 mg/kg body weight/day based on a NOEL of 4.2 mg/kg/day from a 1-year dog feeding study with a safety factor of 100. This value has been approved by the Tox Branch ADI Committee (12/19/86) and verified by the Agency reference dose committee (07/15/87).

2. The food uses evaluated were those established under 40 CFR 180.399 and 21 CFR 193.253, the proposed experimental use on stored field corn grain, and proposed uses on the following commodities: strawberries (7F3510), tomatoes (7F3545), celery (7F3554), and rice (6F3443). Since the last TAS analysis of exposure to iprodione (memo Tomerlin to Rossi, 04/21/88), tolerances have been established on caneberries at 25 ppm and

16

potatoes at 0.5 ppm (Personal communication Mario Fiol, 06/13/88). Table 1 provides a complete listing of residues used in the analysis.

3. The TAS routine chronic analysis calculates the Theoretical Maximum Residue Contribution (TMRC) for the U.S. population and each of 22 population subgroups (see Table 2) and compares this exposure estimate to the reference dose (ADI in this case).

The TMRC from all established and proposed food uses for the overall U.S. Population was calculated to be 0.058696 mg/kg body weight/day, which occupies approximately 147% of the ADI. The two most highly exposed population subgroups were non-nursing infants (TMRC = 0.165949 mg/kg/day or 415% of the ADI) and children, 1-6 years (TMRC = 0.136620 or 342% of the ADI). The effect of the current action (PP#7G3525; field corn grain) on exposure is shown below:

	<u>Established Tolerances</u>	<u>Current Action (Corn Grain)</u>	<u>Other Proposed Uses</u>	<u>Total Exposure</u>
U.S. Population	0.044019 ^a (110.0%) ^b	0.006679 (16.7%)	0.007998 (20.0%)	0.058696 (146.7%)
Infants (Non-Nurs)	0.129277 (323.2%)	0.019542 (48.9%)	0.017130 (42.8%)	0.165949 (414.9%)
Children, 1-6 yrs.	0.104793 (262.0%)	0.017316 (43.3%)	0.014511 (36.3%)	0.136620 (341.5%)

^aTMRC expressed as mg/kg body wt/day.

^bTMRC as a percent of the ADI.

4. These exposure estimates are based on the assumption that residues would be present at tolerance levels on foods as eaten and that 100% of crops would be treated with iprodione. Since the proposed EUP would involve treating a maximum of 160,000 bushels of corn, or less than 0.01% of the total U.S. corn production (from 1986 Agricultural Statistics), and since residues in foods as eaten are often reduced by processing (washing, cooking, etc.), the actual exposure would likely be considerably lower than that which is reported here.

CC: Stanton (RCB), Propst (RCB), TAS File, PP#7G3525, Iprodione SF, TOX, Circulation (7), RF, PMSD.
